## CLAIMS

What is claimed is:

1. A terrestrial communication system using satellite uplink and downlink frequencies used by satellites, comprising:

at least one terrestrial user terminal transmitting, without using said satellites, a first signal on at least one satellite downlink frequency and receiving, without using said satellites, a second signal on at least one satellite uplink frequency.

- 2. The terrestrial communication system of claim 1, wherein said terrestrial communication system includes a signal nulling means in the direction of said satellites that produces signals using said uplink and said downlink frequencies.
- A terrestrial communication system using satellite uplink and downlink frequencies used by satellites, comprising:

a terrestrial terminal unit producing a first signal at a satellite downlink frequency that is transmitted without using said satellites within the terrestrial communication system, and

said terrestrial terminal unit receiving a second signal at a satellite uplink frequency that was transmitted without using said satellites from within the terrestrial communication system.

 The terrestrial communication system of claim 3, wherein a satellite ground user using said uplink and said downlink frequencies is geographically isolated from said terrestrial terminal unit. A method of minimizing interference between terrestrial user communications and satellite user communications, comprising;

reversing the transmission and reception frequency bands for the terrestrial user relative to the satellite user.

- The method of claim 5, further comprising generating at least one pattern null with an antenna to reduce satellite interference.
- 7. A method of reusing satellite spectrum for terrestrial communications, comprising:

assigning satellite frequency bands so that terrestrial users and satellite users on the ground within the same geographic region are using different satellite uplink and downlink bands;

adding pattern nulls to terrestrial antennas, that transmit and receive signals from terrestrial users, to block satellite interference.

8. The method of Claim 7 wherein the step of assigning comprises assigning transmission and reception bands to terrestrial users, wherein the transmission and reception bands are satellite downlink and uplink bands respectively.
